Project Blueprint: "The Floor Test"

Architecture: HTML5, CSS3, Vanilla JavaScript
Deployment Environment: Optimized for local testing on Ubuntu machines.

1. Core Structure & Routing

- **Single Page Application (SPA):** Implement vanilla JS routing to navigate between Chapters (1-4) without page reloads.
- **State Management:** Use LocalStorage to save user XP, Rank ("Backbencher" to "Prime Minister"), and chapter unlock progress.

2. The 3-Phased Loop (UI/UX Guidelines)

Phase 1: Learn

- **Data Visualizations:** Implement interactive canvas or SVG charts for the Majority calculators. The visualizations must be top-tier, resembling professional outputs from tools like R Studio or Python data libraries.
- **Timeline Scroller:** Create a horizontal scroll interface for historical anchors. Ensure the layout is highly visual, optimized for someone who might adapt these segments into a historical YouTube video series (e.g., highlighting events like the Indigo Commission or the GST Act).

Phase 2: Play

- **Drag-and-Drop Simulator:** Use the HTML5 Drag and Drop API. Users drag "MP Tokens" (representing variables like 'Present', 'Voting', 'Vacant') into 'Aye' or 'Nay' drop zones.
- **Logic Engine:** Write JS functions that calculate the exact formulas (e.g., Simple Majority > 50% of Present & Voting) in real-time as tokens are dropped.

Phase 3: Practice / Examine

- **Difficulty Scaling:** Design the assessment logic to simulate the rigor of national-level competitive exams (aiming to challenge users who might be targeting an All India Rank within the top 200).
- **Timer Mechanism:** Implement a strict JavaScript `setInterval` countdown for the Time-Attack quizzes.

3. Styling (CSS)

- **Responsive Design:** Mobile-first approach using CSS Flexbox and Grid.
- **Theme:** Institutional yet modern. Primary colors: Deep Navy (#1a365d), Gold (#c59b27), and White (#ffffff).
- **Animations:** Smooth CSS transitions for the Tinder-style swipeable concept cards and drag-and-drop feedback.
